

FIG. 1

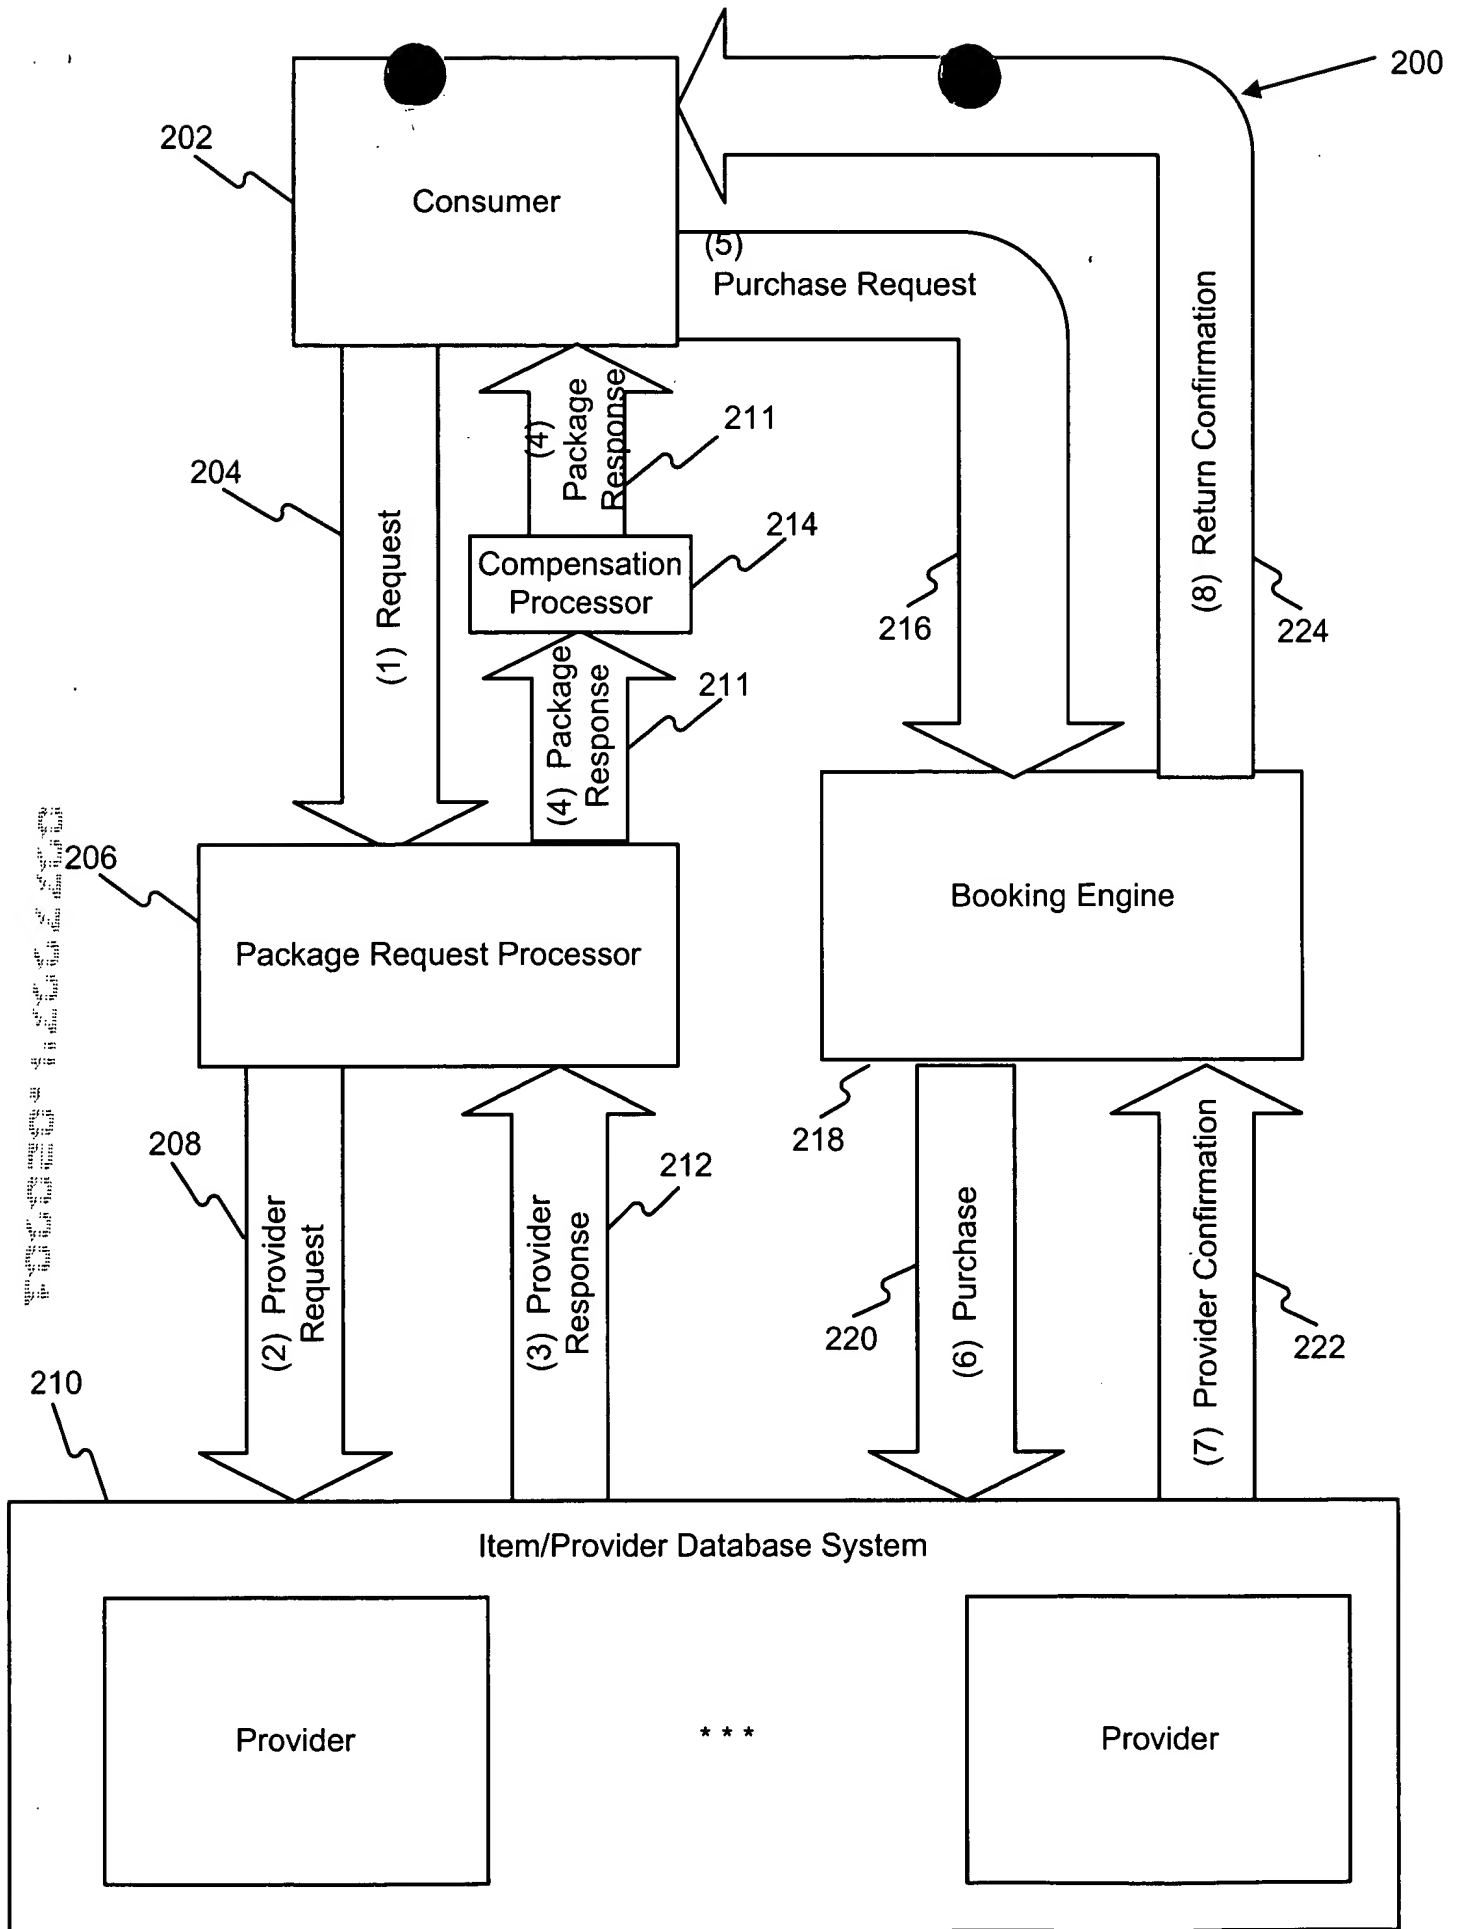

FIG. 2

FIG. 3 is a flowchart illustrating a process for generating a package based on a request from a consumer. The process begins with receiving a request from a consumer (206). The request is then used to identify potential providers (302). This step involves querying a database system (210) which contains items and agreements. The query/response (310) is used to generate a package (304). The package is then submitted to a compensation processor (306) and finally, the package information is returned to the consumer (308).
